

Dear Hiring Manager/ Team,

AI is evolving from simple chat interfaces to complex, reasoning agents—and I have spent the last several years at the forefront of this shift. I am writing to apply for this role, bringing 7+ years of experience in building AI systems that don't just "work," but deliver documented ROI.

Currently, I lead the development of Generative AI applications where I've achieved a 60% reduction in document search time for users by architecting sophisticated RAG pipelines. My expertise goes beyond basic prompting; I specialize in:

- **Agentic Workflows:** Designing multi-step reasoning agents using LangGraph to automate complex decision-making.
- **Enterprise Observability:** Using LangSmith and RAGAS to move GenAI from "cool demo" to "production reliable" by quantifying retrieval relevance and accuracy.
- **End-to-End MLOps:** Productionizing models using FastAPI, Docker, and Azure ML, ensuring that high-performing models actually reach the end-user efficiently.

My career began in software engineering and evolved through Data Science and MLOps. This journey has given me a rare perspective: I understand the mathematical foundations of an algorithm, the engineering requirements of a data pipeline, and the operational necessity of a CI/CD workflow.

I look forward to discussing how my technical background can help solve your most pressing AI challenges.

Sincerely,

Vinay Babu Gorantla
